## **SECTION B - SUMMARY OF WORK**

### **B.1 REQUIREMENT**

Conduct Work in accordance with Contract Provisions, these Specifications, and associated Maps.

### **B.2 LOCATION**

All Work is to be performed in watersheds that drain into the Mainstem of the John Day River upstream of Mount Vernon.

### **B.3 INTENT**

B.3.1 The intent of this Work is to remove and dispose of undesired vegetation within the landowner's property to reduce the risk of wildfire and improve the overall health and resiliency of the timber and rangelands in the vicinity.

B.3.2 Grant Soil and Water Conservation District (District) will enter into a Contract with a qualified vendor to conduct the above Work and will administer the Contract and finances of the Project.

### **B.4 SEQUENCE OF WORK**

It is understood that time is of the essence in the execution of this Contract. All Work elements must be completed by December 31<sup>st</sup>, 2027.

### **B.5 PRINCIPAL COMPONENTS OF WORK**

B.5.1 All participating property owners have signed Cooperator Agreements with the District to allow the Work; however, the Contractor shall be responsible for contacting owners to inform them regarding the details of when the Work will be conducted.

B.5.2 Treatment of non-commercial thinning through cutting, pruning, piling, and burning in accordance with Section C – Site Work.

### **B.6 MINIMUM AREA**

Impacts will be confined to the minimum area necessary to complete the Project.

## SECTION C – SITE WORK

### C.1 CONIFER CUTTING

Work items shall consist of cutting or clipping of conifers from seedlings to mature trees within the treatment areas. Work shall be thin-from-below treatments and shall be consistent with the Site Specifications Tables for each treatment site within the project.

- Stump heights shall be less than twelve (12) inches (uphill side); trees shall be completely severed from stumps, and all living vegetation on the stump or attached by branches will be sheared and removed.
- Acceptable cutting methods can include chainsaws, loppers, hand saws, mechanized equipment with mounted hot saws, hydraulic shears, or other district-approved methods. Mechanized cutting will be done when soils are dry or frozen, and removal practices will be performed to minimize soil disturbance.
- Trees to be left after the project (“Leave Trees”) shall be determined by the contractor based upon the parameters outlined in each site location’s Site Specifications Tables. The Contractor shall, at all times, direct his/her activities in such a manner as to minimize adverse impacts to the leave trees.
- Areas around homes, buildings and other infrastructure may contain marked trees for removal. These areas have been designated on the attached property maps.
- Starting Basal Area shall be based upon the inventory taken from the site by District staff.
- Targeted Basal Area shall be determined by the landowner and District staff and is measured as an average over the entirety of the project.
- Estimated Basal Area to be Removed shall be the estimated amount of material to be removed from the project site to accomplish the Target Basal Area.
- Desired Species shall list the species of trees with the highest priority, for selection purposes, and shall be listed in order, starting with the most desirable.
- Tree Diameters shall be listed as a maximum diameter at breast height allowed for removal.

- Diseases Present shall list the known diseases in the project site and shall be used to influence which trees shall be taken. Any additional specifications regarding disease shall be listed in the Comments section of the Site Specifications Tables.
- Variable Density Mosaic shall be listed as “YES” or “NO.” If designated “YES”, shall indicate the creation of tree clumps, wildlife patches, and openings to increase stand diversity and stocking variation, return stands to a structure that is characteristic of the historical stand conditions and fire regime, maintain an appropriate basal area range across the entire stand, and break up the continuity of the canopy to reduce fuels in the profile. If designated “NO” the desired outcome shall be even spacing based on basal area specifications.
- Mastication shall be listed as “YES” or “NO.” A designation of “YES” indicates mastication as a viable option for treatment per site. If a designation of “NO” is given, mastication will not be allowed as a treatment option for the designated site. For mastication specifications, see Section C.3 MASTICATION
- Pile Sizes shall list the maximum pile size allowed per the project site. Additional information regarding pile sizes shall be provided in section C.4 SLASH PILING and within the Comments section of the Site Specifications Tables.
- Comments shall contain items such as, but not limited to, a description of additional specifications for Mastication, Diseases Present, Pile Sizes, geographical description, landowner-specific requirements, and or tree marking.
- District will secure necessary permits from ODF.

## **C.2 LEAVE TREES PRUNING**

Work items shall consist of pruning limbs from Leave Trees in order to reduce their ability to function as ladder fuels.

- All live and dead limbs shall be pruned around the bole up to six feet and no more than 10 feet from the ground.
- Limb stubs shall be flush cut with the branch collar while keeping the bark layer intact.
- Pruned limb stubs attached to the tree shall be less than 2 inches.

## **C.3 MASTICATION**

The landowners have declined to allow mastication on their properties; no mastication will be used to treat conifers for this project

#### **C.4 SLASH PILING**

Work items shall consist of piling all trees and limbs generated during cutting.

- All cut trees shall be moved so no part is within five (5) feet of any part of a live tree; piles should also be no closer than five (5) feet from any part of a live tree.
- Piles shall be constructed in such a manner as to easily ignite, combust completely, contain the fire within the pile perimeter, and do minimal damage to residual trees.
- To facilitate rapid and more complete combustion of slash piles, it is recommended that they be constructed by stacking smaller diameter material on the bottom and placing larger diameter material on top. Keeping the curvature of placed material in the same direction, consistent with the piled limbs, will result in denser piles; a dense inner portion of the pile maintaining minimal void spaces covered by a looser outer layer will typically burn the best.
- Unless noted in the Site Specifications Tables for each property, minimum pile size shall be five (5) feet high and six (6) feet wide by six (6) feet in length; maximum pile size shall be either be no greater than sixty (60) feet long by twenty (20) feet wide by twenty (20) feet tall.
- Piles should be spaced sufficiently far enough apart to prevent unintentional ignition during burning.

#### **C.4 PILE BURNING**

Work items shall consist of burning the slash piles generated by the project in such a manner that they are 90% consumed while not damaging live trees.

- District will obtain any necessary permits.

#### **C.5 MEASUREMENT AND PAYMENT**

##### **C.5.1 Cutting/Pruning/Piling/Brushing/Burning:**

- Measurement: The perimeter of the area around the stumps after the trees have been cut and piled will be measured in the field to the nearest tenth (0.1) of an acre.

- Payment: Price per acre of work performed as stated in the pricing schedule. Payment will only be issued for fully completed and District-approved portions of the project area.
- Progress Payments: Shall be paid upon the completion of 40-acre increments, upon the completion of a landowner's property, or upon other intervals with prior approval by the District.
